What is the Citra emulator? Citra was the first Nintendo 3DS emulator for PC. It was first released by developer Team Citra in 2014, and gradually added support for more games over the years. Pirando 3DS games is still very illegal. Even if you own the ROMs download cartridge it remains a legal gray area. The only legal way to get 3DS ROMs is to dump them yourself from a cartridge you own. Citra has a brief guide on that here. Citra wasn't released on Android a few years ago? The Android app that was released in 2018 was not an officially licensed app by Citra. This initial application was developed by SachinVin, an independent developer outside Citra's official team. Although the app was a great start to what Citra users had been requesting, it had some performance issues. Citra's team said that performance issues with the app developed by SachinVin led to an increase in support requests and team features - that it had nothing to do with that unofficial Android port and that while the team applauded the efforts of this developer, [they] had to deny providing support for it because it was unofficial. Although Citra's team was unable to support this app, they invited SachinVin to collaborate with them to produce an application that Citra users would love (and really be able to use). We tested this unofficial app on the Samsung Galaxy S20 Ultra and 7 Pro earlier this year, and you can read all about the results below. There were multiple problems that needed fixing after Citra brought SachinVin to the team. The settings within the app were not saved, the button overlay was reduced and there were many graphic and design design issues Not bad. These issues had to be fixed, then tested, then corrected again, and so on. Android is a delicate system to work with. So you had to put a lot of work into the app before presenting it to the public. In addition to troubleshooting technical issues, Citra also implemented quite a few performance-helping features. To list some, GPU emulation on one of the CPU cores, OpenGL ES settings, the ability to use the phone keyboard in games that need it, motion control support and camera/microphone functionality. One of the best additions was the ability to use an external gamepad with the app. A member of Citra's team realized how many people would want gamepad support, so they worked on it. Works with almost all gamepads. So if you have one, you don't have to worry about using annoying touchscreen controls. Citra's team even says that if your gamepad doesn't work, you can contact them on your Discord server; they will try to figure out what the problem is and make their gamepad work. That's so cool!
